

Assignment

Your need to create an ATM banking system.

1. *You have Json named (rohit.json).*
2. *Your file contains all information that requires to withdraw money from ATM.*
 1. *Account_number*
 2. *ATM_pin*
 3. *Account_type*
 4. *Balance*
 5. *Mobile number*

You will need to write a python code.

All four information above you will read from json file. After that you will ask all credentials from customer if all information is correct and customer has sufficient balance in his account than customer can withdraw money.

Note: if one credential is wrong you will not ask next credential. You will terminate transaction same time.

After money withdrawal you will update remaining balance in your file and dump is as json file again in same balance section.
